Race

## Aim:

Five bikers compete in a race such that they drive at a constant speed which may or may not be the same as the other.

To qualify the race, the speed of a racer must be more than or equal to the average speed of all the 5 racers.

Take as input the speed of each racer and print back the speeds of qualifying racers.

Write a class Race with a method main(String[] args). The main method receives five arguments. You can write code to parse them into double data type.

```
For example, if the values 54.55, 53.57, 54, 56.25, 57.30 are passed as arguments to the main() method, then the output should be

The speed of the racers >= average speed 55.134 : 56.25 57.3.
```

Note: Make sure to use the print() method and not the println() method.

## Source Code:

## Race.java

```
class Race
{
    public static void main(String a[])
    {
        double[] arr=new double[5];
        double average,sum=0;
        for(int i=0;i<5;i++)
        {
            arr[i]=Double.valueOf(a[i]);
        }
        for(int i=0;i<5;i++)
        sum+=arr[i];
        average=sum/5;
        System.out.print("The speed of the racers >= average speed "+average+": ");
        for(int i=0;i<5;i++)
        {
            if(average<=arr[i])
            System.out.print(","+arr[i]);
        }
    }
}</pre>
```

	Test Case - 1										
Us	User Output										
The	speed	of	the	racers	>=	average	speed	54.855999999999995:	,81.6,58.19,79.42		

Test Case - 2								
User Output								
The speed of the racers >= average speed 78.0032: ,96.21,87.26,105.63
